

SOUTHERN UNIFORM WINTER WHEAT SCAB NURSERY

2005 NURSERY REPORT

J. P. Murphy
R. A. Navarro

This is a progress report of cooperative investigations underway and funded by the U. S. Wheat and Barley Scab Initiative, State Agricultural Experiment Stations, private companies and the United States Department of Agriculture, Agricultural Research Service. This report contains preliminary data that have not been sufficiently confirmed to justify general release; interpretations may be modified with additional experimentation. Confirmed results will be published through established channels. The report is a tool for the use of the cooperators and their official staff and those persons having direct interest in the development of agricultural research programs. This report is not intended for publication and should not be referred to in literature citations or quoted in publicity or advertising. Use of the data may be granted for certain purposes upon written request to the authors.

This material is based upon work supported by the U.S. Department of Agriculture, under Agreement No. 59-0790-4-117. This is a cooperative project with the U.S. Wheat & Barley Scab Initiative. Any opinions, findings, conclusions, or recommendations expressed in this publication are those of the authors and do not necessarily reflect the view of the U.S. Department of Agriculture.

TABLE OF CONTENTS

Location Notes	3
Photographs from the 2004-05 Season	6
Entry List and Pedigrees, 2005 Nursery	7
FHB Incidence	8
FHB Severity	9
FHB Severity by Individual Isolates, Szeged, Hungary	10
FHB Severity by Individual Isolates, Fundulea, Romania	11
FHB Severity expressed as AUDPC, Fundulea, Romania	12
FHB Severity, GGE Biplot Analysis	13
FHB Index	14
Field Visual Ratings and Disease Spread in Spikelets	15
Percent and Weight of Fusarium Damaged Kernels	16
Fusarium Damaged Kernels % GGE Biplot Analysis	17
Incidence, Severity, Kernel Rating (ISK) Index	18
1000 Grain Weight	19
Grain Yield and Quality, Szeged, Hungary	20
Vomitoxin (DON)	21
Greenhouse Screening (Head Severity)	22
Greenhouse Screening (Rachis Involvement and Seed Quality)	23
Detached Leaf Evaluations, Nyon, Switzerland	24
SSR Analyses of 3BS and 5A Regions Associated with FHB resistance	25
Heading Date	26
Plant Height	27
Leaf and Viral Disease Ratings	28
Hessian Fly Screening	29
Means Across Locations	30
Genotype-by-Trait Biplot	31
Correlations Between Traits	32

LOCATION NOTES

Bay, Arkansas

- Cooperators: June Hancock, Luis Lazoanaya, David Hill, and Richard Grey Syngenta Seeds Inc.
- Reps: 2 Plot size: 2 rows 2 ft long.
Seed date: 11/15/04. Planted about one month late and remained wet all winter. Poor stands.
- Inoculation method: Infected corn kernels.
- Precipitation during grain fill: Misted daily, morning and evening.
Avg temp. during grain fill: Day 65-70, Night 45-50. Temperatures cooled down at start of heading. Heading was delayed. Mid-May was hot and dry with little humidity.

Fayetteville, Arkansas

- Cooperators: Gene Milus.
- University of Arkansas

Urbana, Illinois

Cooperators: Fred Kolb and Eric Brucker.

- University of Illinois
- Reps: 3 RCB. Plot size: 1 row x 3'. Seed date: 9/30/04. Harvest date: 6/29/05
- Fertilizer: 40 lb N/ac. preplant. P and K okay; no spring topdress.
- Inoculation method: Grain spawn and corn stalks.
- Precipitation during grain fill: Misted three times per day during flowering. Limited natural precipitation.
- Greenhouse inoculation method: Point inoculation (1,000 spores injected into one floret per head).

Lexington, Kentucky

- Cooperators: Carrie Knott and D. Van Sanford
University of Kentucky
- Reps: 2 RCB. Plot size: Two 4' rows. Seed date: 11/08/04. Harvest date: 6/7/05
- Fertilizer: P, K, according to soil tests, 110 lb N split application
- Inoculation method: Scabby corn
- Precipitation during grain fill: 3.59 in.
- Avg temperature during grain fill: 70°F.
- Greenhouse Inoculation method; Point inoculation.

Blacksburg, Virginia

- Cooperators: Jody Fanelli, Jianli Chen and Carl A. Griffey.
Virginia Tech
- Reps: 3 RCB Randomized complete block. Plot size: 4 x 5 ft (20 ft²).
- Inoculation method: Conidial suspension (5×10^4 spores / ml) sprayed at anthesis (field), point inoculation (greenhouse).

Kinston, North Carolina

- Cooperators: Rene Navarro, Paul Murphy, Christina Cowger.
North Carolina State University
- Reps: 2 RCB. Plot size: 4 rows x 3.5' long. Seed date 10/22/2004. Harvest date: 6/14/2005.
- Fertilizer: 130 lbs N split application. P and K as per soil test.
- Field Inoculation method: Conidial suspension (3×10^4 spores/ml) sprayed on plots at anthesis. Corn stalks distributed in spring at jointing. Scabby corn distributed two weeks prior to anthesis.
- Precipitation during grain fill: Misted three times per day for 3 weeks beginning at anthesis.
- Greenhouse: point inoculation with 10 μL at 50,000 spores per ml.
- Avg temp. during grain fill: 63F

Columbia, Missouri

- Cooperator: Anne L. McKendry.
University of Missouri
- Reps: 4 RCB. Plot size: 30in x 28in. Seed date: 10/25/04. Harvest date: 7/7/05
- Field inoculation method: Sprayed at 75% heading with a suspension of *Fusarium graminearum* macroconidia concentrated to 50,000 spores/mL
- Precipitation during grain fill: Overhead mist irrigation
- Greenhouse inoculations result from point inoculations of a basal central floret with 10 μL of a 50,000 spores/mL suspension of *Fusarium graminearum* macroconidia

Salisbury, Maryland.

- Cooperator: Jose Costa, Neely Gal-Edd and Aaron Cooper.
University of Maryland.
- Reps: 2 RCB. Plot size: 1 rows x 4' long. Seed date: 10/18/04. Harvest date: 6/24/05.
- Fertilizer: 160 lbs N.
- Field inoculation method: Planted following corn and corn grain infected with *Fusarium* scattered one month before anthesis.
- Precipitation during grain fill: Misted morning and evening. Irrigation as needed.

Szeged, Hungary.

Cooperator: Akos Mesterhazy.
Cereal Research Institute.

- Seed date: 10/22/04. Harvest date: 6/24/05.
- Fertilizer: NPK
- Field inoculation method: Four separate isolates sprayed on each plot on 5/31/2005 and inoculated heads enclosed in plastic bags.
- Precipitation during grain fill: Excessive precipitation in May (80 mm) June (70 mm), and July (70 mm).
- Winter temperatures were average with snow in February and minimum temperatures of -15 to -20 C. Cool spring delayed growth by 7-10 days. Severe Septoria and abundant leaf rust and virus.

West Lafayette, Indiana.

Cooperator: Sue Cambron

USDA-ARS, Department of Entomology

- The 2005 USFHBN was screened in the greenhouse to two biotypes of the Hessian fly.
- Greenhouse flats containing 12 rows each were divided into half rows. Four standard differentials (H7H8, H5, H3, and H6) were seeded in the four central half-rows with 15-20 seeds per entry seeded in the other 20 half-rows. This was duplicated for biotypes O and L.
- Bulk infested plant material was placed under a cheesecloth tent where adult flies were allowed to emerge, mate and oviposit for 24 – 48 hours, at which time the adults were removed.
- The eggs hatched in three to four days and the plant material was maintained for the following 18 days when the plants were rated for resistance.
- Plants of each entry were scored as resistant or susceptible based on plant phenotypic reaction.

Nyon, Switzerland

Cooperators: R. A. Browne and F. Mascher.

Agroscope RAC Changins.

- Detached leaf assay: Two repeated experiments each consisting five replicates (four leaves per replicate) inoculated with *Microdochium majus* [Glynn et al (2005) Myc Res 109, 872-880] (Formerly *Microdochium nivale* var *majus*) Irish isolate OP2A. Inoculation and disease development parameters, Incubation Period and Latent Period, assessed as described by Browne and Cooke (2004) Eur J. Plant Pathol. 110, 91-102

Fundulea, Romania.

Cooperator: Marianna Ittu.

Agricultural Research Development Institute

Photographs From The 2004-05 Season

Left and Right Above: Fusarium Head Blight on susceptible varieties in Crowley, Louisiana, 2005. The epidemic resulted from natural inoculum. Subsequent analysis of Louisiana isolates found a significant proportion of *F. asiaticum*, a nivalenol producer that was considered infrequent in the U.S.

Left: Carl Griffey and Wynse Brooks, (Virginia Tech) discuss FHB research with Christina Cowger (USDA-ARS) in a mist irrigated nursery at Kinston, N.C.

Left: Partially resistant and susceptible check genotypes in a mist irrigated FHB wheat segregating population nursery at Mt. Holly, VA.

Color photographs courtesy of Steve Harrison, Paul Murphy and Carl Griffey at web version of report:

FHB Severity

GGE Biplot Analysis¹

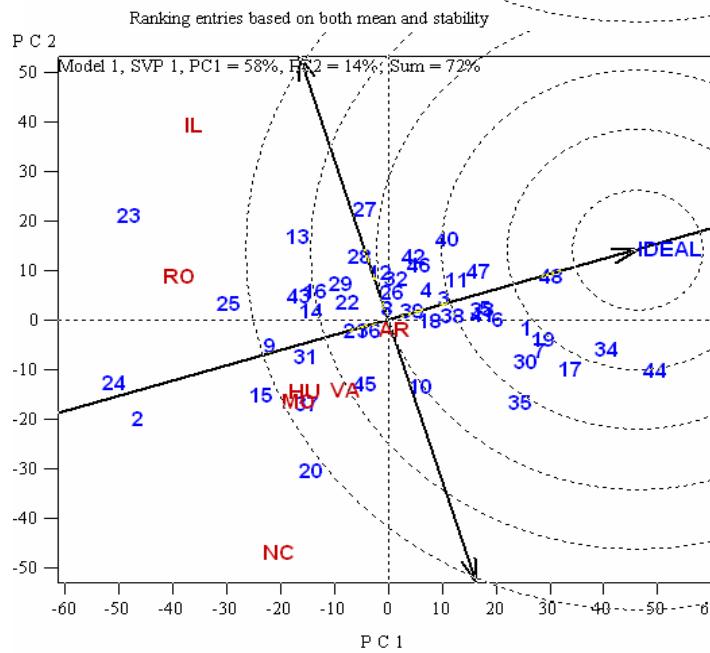

Test location main effect accounted for 55% of the variation in FHB Severity. Seven of nine test locations formed a relatively tight cluster with Lexington, KY and Salisbury, MD being outliers. Entry main effects accounted for 18% of variation and Entry x Test Location accounted for 27% of variation.

The Average Environment Coordinate abscissa (single arrowed-line passing through the biplot origin) approximated the mean Severity of entries. Entries towards the right of the abscissa had lower overall Severities while entries towards the left of the abscissa had the highest Severity scores.

Entries 44, 19, 17, 7, 1, 5, 6, 34, 11 and 3 all fell within two concentric circles of the 'Ideal' entry.

The Average Environment Coordinate ordinate (double-arrowed line perpendicular to the abscissa) approximated the genotype x location (GxE) interaction associated with each entry. The greater the projection onto the ordinate, in either direction, the greater the instability of the entry over locations. Most of the more resistant entries exhibited stability, with the possible exception of entry 34.

13

Elimination of the outlying Kentucky and Maryland locations reduced the Entry x Test Location interaction contribution to 19% of variation, but did not alter the overall results substantially. All the previously mentioned entries maintained their resistance ratings, but entries 30, 33, 47 and 48 were added to the most resistant entry list. In fact, entry 48 was closest to the 'Ideal' in the new analysis and entries 44, 7, 19, 34 and 17 all exhibited lower stability than the very stable entry 48.

¹Yan, W., and M. S. Kang. 2003. GGE Biplot Analysis. CRC Press, Boca Raton, FL.

Fusarium Damaged Kernels % GGE Biplot Analysis

Bay, Arkansas was an extreme outlier when all six locations were included in a single analysis. This location was dropped and the resulting biplot is shown (left). Location main effect accounted for 75% of the variation in FDK %. Columbia MO, Fayetteville AR and Salisbury MD clustered together, while Lexington KY, and Urbana IL were more unique and discriminating.

Entry main effects accounted for 10% of variation in FDK % and Entry X Location interaction accounted for 15% of variation. The Average Environment Coordinate abscissa (single arrowed line passing through the biplot origin) approximated the entry effect. Entries towards the right of the abscissa had lower overall FDK % scores, while entries towards the left of the abscissa had the highest FDK % scores.

Entry 48 was closest to the 'ideal' entry, and entries 1, 3, 11, 28, 33, 34 and 47 all fell within two concentric circles of the ideal.

The average Environmental Coordinate ordinate (double arrowed line perpendicular to the abscissa) approximated the genotype x environment interaction associated with each entry. The greater the projection on to the ordinate, in either direction, the greater the instability of the entry over locations. Entries 11, 33 and 48 were the most stable of the more resistant entries.

Incidence, Severity, Kernel Rating (ISK) Index¹
(0.3 * Incidence + 0.3 * Severity + 0.4 * Fusarium Damaged Kernels)

Genotype-by-Trait Biplot

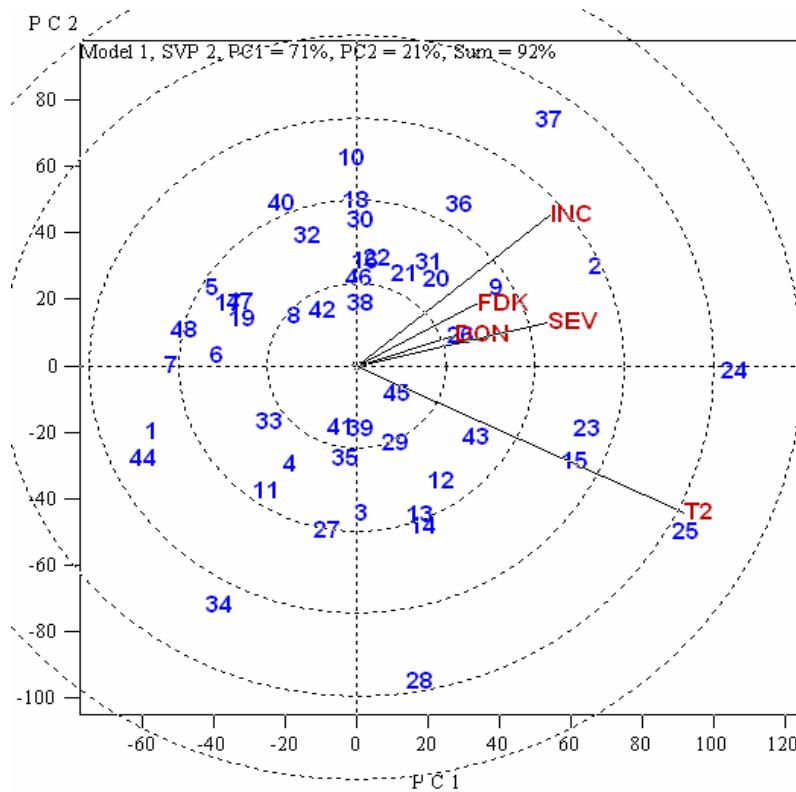

The FHB Index and ISK were omitted from this analysis.

The theoretical ‘Ideal’ entry, represented by the small circle with the arrow pointing to the center, had the best combined resistance when the variables Incidence, Severity, FDK, DON and Greenhouse Type II resistance were considered. Entries 44, 1, 7, 48 and 34 fell within, or on the circumference of the smallest circle, indicating they were closest to the “Ideal” entry. Entries 4, 11 and 33 also displayed relatively consistent rankings across the different resistance measurements.

Correlations Between Traits Over Locations

	SEVERITY	INDEX	FDK	ISK	DON	G'HOUSE TYPE 2	HEADING DATE	PLANT HEIGHT
INCIDENCE	0.77	0.88	0.64	0.87	0.67	0.41	0.32	ns
SEVERITY		0.94	0.69	0.89	0.80	0.70	ns	ns
INDEX			0.72	0.94	0.77	0.56	0.28	ns
FDK				0.86	0.77	0.44	ns	ns
ISK					0.82	0.51	ns	ns
VOMITOXIN (DON)						0.59	ns	ns
G'HOUSE TYPE 2							ns	ns
HEADING DATE								ns

Vector view of the entry-by-trait biplot showing the interrelationships among resistance traits. Field-based estimates of Incidence, Severity, FDK and DON had greater correlations with each other than they had with greenhouse-based Type II resistance. Greenhouse Type II was the most discriminating variable in that it displayed the largest standard deviation, followed by Incidence, Severity, FDK and DON.

Entry 25 was the most susceptible based on greenhouse TypeII evaluation and Entry 2 (the susceptible check) displayed the greatest average susceptibility based on the combined estimates of Incidence, Severity, FDK and DON.
